Introduction

The world of butterflies has always exercised a constant fascination on humans by the beauty of the wings colouring, by the symmetry of their complicated drawing, by their interesting and enigmatic ontogenetic development.

Butterflies constitute a very beloved group of creatures, thoroughly studied compared to other groups of invertebrates. Among other insects, the Lepidoptera constitute an important link in the natural food chains.

„Butterflies have a key role as pollinators in their ecosystems” emphasizes Dr. Jane Smart, Global Manager of International Union for Conservation of Nature (IUCN), in charge of the Red List of Threatened Species.

The extinction, at the local, regional or national level, of certain butterfly species has long been reported in Europe. Almost 10% of the butterfly species in Europe are endangered.

The Museums of Natural Sciences house collections of great scientific value, with specimens from the flora and fauna of Romania, collections which have to be known nationally and internationally.

Thus, to know the diversity of the Lepidoptera species in a certain area of the country, by preparing catalogues, form of research – evidence of the museum heritage, constitutes a desideratum and is a necessity both among entomologist curators, as well as among the ones dealing with the conservation of habitats, species and their protection.

The origin and composition of the collection

The Lepidoptera collection found in the museum heritage is composed of collections obtained from purchases from renowned entomologists: Dr. Alexei Alexinschi (1899–1966), Prof. Ioan Nemeș (1924–2009), Prof. univ. dr. Victor Nadolschi (1911–1996), and of the material collected by the specialized staff of the institution.

- the Alexei Alexinschi collection includes 546 species (966 specimens) collected in Northern Romania (Maramureș, Suceava, Botoșani, Iași.), as well as from other places in the country (Galați, Tulcea, Constanța) between 1913 and 1959.

- the Ioan Nemeș Microlepidoptera collection, with 1000 specimens comprised in 318

species collected from places in Suceava and Galați counties and accurately identified by the author.

- the Victor Nadolschi collection with material collected from places in Bacău county between 1968 and 1975, with 13200 specimens.

The collector activity of Professor Victor Nadolschi was completed with the one of collaboration with Romanian and foreign specialists. The collector received in exchange Lepidoptera material from the places in Timiș, Sălaj counties, identified by Frederik König, material from Vadim Neaga from the area of Old Moldova (CS), Ioan Gabe (Iași), Marin Moldoveanu (Reghin-MS), Adalbert Takács from Cluj, Sălaj counties, from Iuliu Szabó from Satu Mare county, Ioan Stănoiu (Craiova) as well as material from the former Socialist Republic of Czechoslovakia, Germany, Poland, Spain and Hungary as a result of the collaboration with Václav Skála and Stanislav Bleszunski.

The most of Microlepidoptera species, some Geometridae and Noctuidae from the Victor Nadolschi collection were identified by Dr. Aurelian Popescu Gorj (1914–1997), some species and forms by Dr. Frederic König (1910–2002). Most of the material is identified by Victor Nadolschi using specialized literature of that time.

The Lepidoptera material, 2450 specimens, collected by the staff of the institution between 1968 and 1980, includes species from the places of Bacău county, as well as from other regions of the country. Thus, this catalogue brings these collections together, totalizing 17575 specimens, from 24 superfamilies, 58 families, 1261 species and 638 genera. (Table no. 1)

Material and method

The material is preserved in the entomology collection of the “Ion Borcea” Museum of Natural Sciences in suitable cabinets, being prepared, labelled, identified and arranged in insectariums, in systematic order. The species are found based on the species records where the number of specimens, inventory number and the insectarium number, their presence in The Red List of European Butterflies, with the indication of the degree of endangerment of the species according to International Union for

Conservation of Nature (IUCN) categories, are indicated.

In the catalogue, for each species we indicate the collection place with the abbreviation of the county to which it belongs, the number of specimens, the date on which the collection was conducted and the person who collected the material. For many of the species listed in the catalogue, the gender is not indicated, especially for Microlepidoptera. The material is presented specifying at the beginning of the row the number of specimens.

The Micro - and Macrolepidoptera list of species was prepared based on a modern nomenclature using current taxonomic works. All synonymies corresponding to the species and subspecies in the collection, which were identified at that time, with other names than the current ones, were introduced. The systematic arrangement of superfamilies was done after Rákósy, Kovács and Goia (2003). The order of families, genera and species follows the „Fauna Europaea” online database (www.faunaeur.org), the taxonomic units being listed in alphabetical order for better accessibility. As a consequence, the systematic list includes the synonymies used in the Lepidopterological publications regarding the species in Romania. In the collection, the specimens are accompanied by the original label of the person who has identified the material, next to which there is a label with the updated name of the species.

The Noctuoidea superfamily is the best represented in the collection, with a large number of species. In the specialized literature, regarding the classification of this superfamily into families, there were controversies, depending on how the authors studied this superfamily, either from a phylogenetic point of view (Hampson 1903-1913; Miller 1991), or following the morphological traits of the species in larva and imago state (Kitching and Yela 1999) or they went with the study up to a molecular level (Michel, 2006). Thus, the Noctuoidea superfamily was divided into the following families: Notodontidae, Arctiidae, Lymantriidae Noctuidae, Nolidae, Pantheidae (Kitching and Rawlins 1998).

Lafontaine and Fibiger (2005) suggest a new classification system, where these families are treated as subfamilies within the Noctuidae family. At the level of „Societas Europaea Lepidopterologica” revisions are still made regarding the classification of this superfamily.

The importance of the collection

The importance of the collection resides in the fact that it also preserves, beside various

common species, rare and endemic species with a special scientific value, several species protected at European and national level.

This catalogue represents a database regarding the diversity and variability of the Lepidoptera species in the central and northern part of Moldova (most of the material comes from Bacău county), but also species from the high areas of the Carpathian Mountains (Hășmaș, Ceahlău, Gilău, Bucegi), Valea Cernei and Danube Delta, important species for the Romanian fauna (see Fig. 1).

The paper is an important source of data regarding the distribution of the Lepidoptera species in Romania, in general and in Bacău county, in particular, where the group was scarcely studied in the past. Apart from a small note by Alexei Alexinschi, in which 90 species are mentioned in Dărmănești – Bacău and from the few specimens captured at Slănic Moldova mentioned in the catalogue of „Ostrogovichii” collection by Aurelian Popescu Gorj, no other faunistic paper of wide scope regarding this group in the area of Bacău county is known. In 1975, Victor Nadolschi publishes a few papers about the Lepidoptera in Moldova's Subcarpathian region.

The high variability of the species is evidenced by large series of specimens belonging to the same species (*Pieris brassicae* L., *Colyas hyale* L.), which allowed their classification by generations and morphs. The name of the morphs and the varieties of many species remained unchanged, as they were determined by the author.

There are also large series of Pterophoridae (*Pterophorus pentadactyla* L., *Emmelina monodactyla* L.) and series of aptera females and couples (♂♀) of certain Geometridae species (*Operoptera brumata* L.)

The collection preserves a large number of species placed on the Red List of European Lepidoptera with a certain degree of endangerment according to IUCN standards for Romania as well as for the region of Moldova (Rakosy, 2003).

The Lepidoptera species presented by families and IUCN categories.

Lasiocampidae: *Malacosoma neustria* L., *Gastropacha quercifolia* L., *Phylodesma tremulifolia* Hb - NT; *Epicnaptera ilicifolia* L. - VU

Endemic species

These species require particular attention due to the specific nature of the habitat they occupy. The *Erebia* genus, known as „glacial relict” presents a high diversity of species in the high mountain regions of the Carpathian Mountains.

Erebia melas carpathicola Popescu Gorj & Alexinschi strictly localized endemit, found in Eastern Carpathians, ***Erebia epiphron transsylvanica*** Rebel - reported in Parâng, Bucegi (Caraiman), ***Erebia manto trajanus*** Hormuzaki – reported in southern part of Eastern Carpathians, ***Erebia carthasianorum*** Fruhs, ***Erebia aethiops*** Freyer, ***Erebia melas melas*** Herbst vulnerable taxa – VU.

Lycaenidae: *Maculineaalcon* Denis&Schiff, *Maculinea arion* L. - EN, *Tomares nogelii dobrogensis* Car. - subspecies found only in south east of Romania, *Polyommatus bellargus* Rott., - CR, *Aricia eumedon* Esp., *Lycaena thersamon* Esp., *Satyrium w-album* Knoch, *Cupido (Everes) decolorata* Stg. - VU, *Satyrium pruni* L., *Polyommatus daphnis* Denis&Schiff. – NT.

Pieridae: *Leptidea morsei* major Grund. - EN, *Aporia crataegi* L. – NT.

Geometridae: *Scopula tessellaria* Boisd., *Orthostixis cribraria* Hb., *Archiearis puella* Esp., *Lythria purpuraria* L., *Abraxas (Calospilos) sylvata* Scop., *Cyclophora ruficillaria* Herrich-Schaf.- VU, *Angerona prunaria* L., *Lycia hirtaria* Clerk., *Lomographa temerata* Denis&Schiff., *Agriopsis*

leucophaearia Denis&Schiff., - NT, *Cyclophora quercimontaria* Bastell - CR.

Noctuidae: *Amphipyra perflua* F., *Autographa cryson* Esp., *Catocala fraxini* L., *Catocala hymenea* Denis&Schiff., *Catocala sponsa* L., *Hydraecia petasitis* Dbl., *Diarsia dahlii* Hb., *Diarsia rubi* Vieweg, *Noctua janthina* Denis&Schiff., *Spaelotis ravidata* Denis&Schiff. – NT, *Pyrocleptria cora* Evers., - CR, *Chryphia muralis* Forst., *Oligia fasciuncula* Hw., *Grammodes (Prodotis) stolidata* F., *Xestia collina* Boisd., *Agrotis crassa* Hb.- VU.

Arctiidae: *Coscinia striata* L., *Arctia festiva* Hfn. - VU, *Callimorpha quadripunctaria* Poda. -NT

Drepanidae: *Drepana falcataria* L., *Falcaria lacertinaria* L., *Tethea ocularis* L., *Ochropacha duplaris* L., - NT.

Lymantriidae: *Arctornis l-nigrum* Mull., *Leucoma salicis* L.– NT, *Laelia coenosa* Hb.- VU.

Notodontidae: *Furcula bicuspis* Brk., *Thaumetopoea processionea* L. - VU.

Nolidae: *Nola confusalis* Herrich-Schäffer, *Nola cucullatella* L. – VU.

In this collection one can also find specimens based on which the description of new morphs was attempted: *Angerona prunaria* f. *minima* Nad. and *Agapethes galathea* f. *bacoviensis* Nad.

The Lepidoptera Collection found in the museum heritage stands out not only by its large number of specimens, but also by the diversity of species and genera, by the special zoogeographical value, as well as by the rarity of certain specimens of certain scientific and aesthetic value which provides the collection with an undeniable informational value for the knowledge of Lepidoptera fauna in Romania.

We thank Prof.univ.dr. Neculai Barabaş who made the existence of this beautiful Lepidoptera collection possible, we also thank Miss. Dr. Gabriela Gurău, Manager, who showed us understanding for the completion of this paper, our colleagues and last, but not least, our colleague conservatoire Andrei Gabriela, who arranged systematically with great care the species, specimens in the chronological order of the collection dates, carried out the labelling, followed the preservation and conservation of the collection.

This catalogue brings new contributions to the knowledge of the Lepidoptera fauna in Bacău county, in particular and in Romania, in general, offering those interested valuable data regarding the diversity and distribution of this group of insects.
